

How to Manage Cancer Pain

This patient guide will help you learn about:

- Different types of cancer pain
- Causes of cancer pain
- When to talk to your health care team about your pain
- Managing your cancer pain
- Where to get more information about cancer pain

What is cancer pain?

When you have cancer pain, it:

- Can be described as hurting or suffering
- May come and go or be with you all the time

Only you know how much pain you feel and how it affects you.
You do not have to accept pain as a normal part of living with cancer.

You may have one or more of the different types of cancer pain described below:

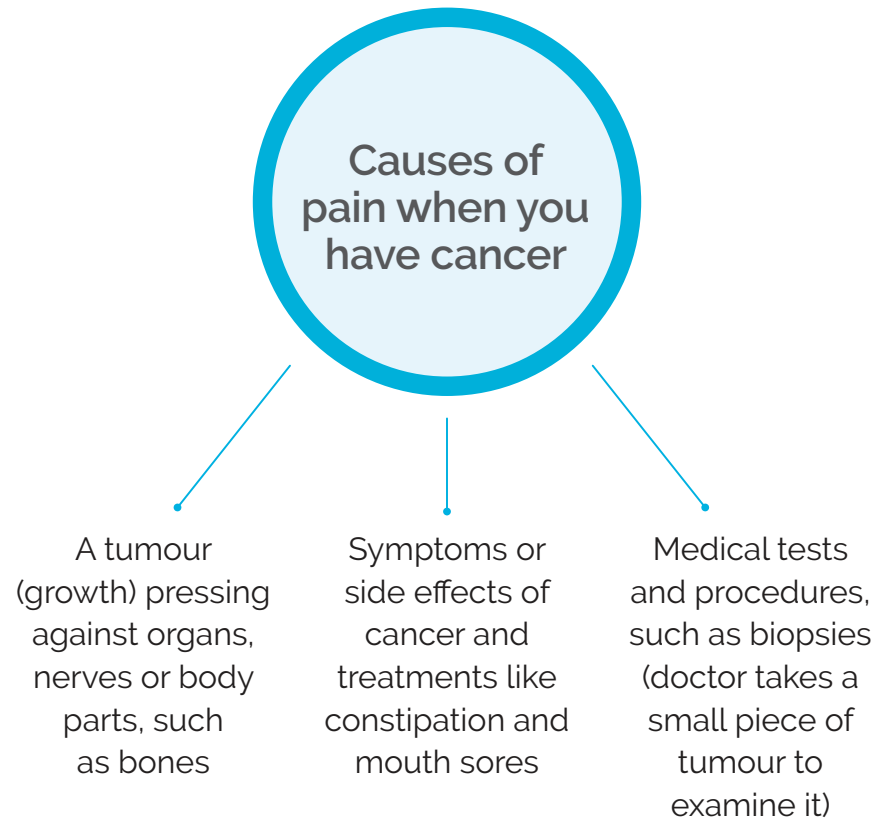

Bone pain can be deep, throbbing or pulsing and may feel sharp at times. Bone pain may get worse when you are moving.

Nerve (neuropathic) pain may feel like burning, shooting, piercing, stabbing, stinging, tingling, or like an electric current. Nerve pain may hurt when things like clothing, water or wind touch your skin.

Soft tissue (visceral) pain is pain in the tissues that surround the organs inside your body, for example tendons, ligaments and some muscles. It might feel like a dull, deep squeezing pain.

Causes of cancer pain

Below are some examples of things that can cause cancer pain. Talk to your health care team about what may be causing pain for you.

Tell your health care team (doctor or nurse) right away if you have any of these symptoms:

- Pain that is not going away or is getting worse
- A new pain that you haven't had before
- Pain when you take a deep breath
- Sudden leg weakness, especially if you have back pain

Managing cancer pain

When your pain is well controlled, you can:

- Sleep and eat better
- Enjoy time with family and friends
- Do your work and hobbies

Things you can do to manage your cancer pain include:

1. Take pain medicine(s)
2. Move your body
3. Try mindfulness and other complementary therapies
4. Other treatments as recommended by your health care team

Your health care team may choose a palliative approach to managing your pain. Palliative care focuses on relieving your symptoms and helping you feel comfortable. It can help people at all stages of cancer and treatments, not only those at the end of life.

Pain medicine

To control your pain as much as possible your health care team will carefully plan:

- The type and amount of pain medicine you take
- How often you take your medicine

Contact your health care team as soon as you can if you are still in pain while taking pain medicine.

You may need to take a combination of prescription and over-the-counter medicines for your pain.

Prescription pain medicines may come in pills, creams or other forms. Prescription pain medicine may include:

- Opioids, which are strong pain medicines such as morphine
- Medicine to treat nerve pain
- Steroids to lessen inflammation (swelling) or slow down the immune system

Over the counter medicines can be purchased from a pharmacy or store without a prescription. Talk to your health care team before taking any over the counter medicines to make sure they are safe for you.

Over the counter pain medicine may include:

- Acetaminophen (Tylenol)[™]
- Ibuprofen (Advil[™] or Motrin[™])
- Muscle relaxants (such as Robaxacet[™]) and rubs (such as Voltaren[™])

Pain medicine usually works best when taken on a schedule. It is easier to prevent pain than to stop it once it has already started. Your health care team will work with you to make sure you are as comfortable as possible at all times. Do not save your pain medicine in case the pain gets worse later.

Breakthrough pain is any type of pain that starts between your regular doses of pain medicine. Breakthrough pain may happen suddenly or when you do not expect it. Having breakthrough pain does not mean that your cancer is getting worse or that you have a new problem.

To prevent breakthrough pain, take your pain medicine on time even if you do not feel pain.

Important things to know when taking opioid pain medicines

Opioid pain medicines cause constipation.

Your health care team may have you take a daily laxative to help you poo while taking these medicines.

Worries about addiction and dependency are normal.

Addiction to opioid medicine is not common for people with cancer but it can happen even if opioids are used as prescribed.

Dependency is not addiction. Dependency is when your body gets used to a drug after taking it regularly. Unpleasant symptoms can happen if you stop taking the drug too quickly. Your health care team will help you make a plan to stop taking your pain medicine slowly.

If pain medicine stops controlling your pain.

For many reasons, your pain may be worse or harder to control at times. Your health care team may need to change the amount or the type of pain medicine that you take.

Your health care team can help if you:

- Have trouble remembering to take your pills
- Need help making a schedule to take your pills at the right time
- Miss a dose of medication
- Feel like your pain medicine isn't working as well as it should
- Have side-effects from your pain medicine

Cannabis (marijuana) for pain

Many people with cancer would like to try different forms of cannabis to help treat symptoms and side effects.

Talk to your health care team about whether cannabis may help your pain.

Exercise or move your body to relieve pain

Small, simple movements or exercises may help with your pain. Talk to your health care team to make sure the activities you choose are right for you.

You could try:

- Getting up to get your own glass of water or snack
- Sitting up instead of lying down
- Walking to the end of your driveway or up and down your hallway
- Gentle stretching

If you are already active, talk to your health care team about how to safely keep your exercise routine.

They may also suggest you speak to a(n):

- Physical therapist
- Occupational therapist
- Registered massage therapist

For more information about exercise, see our exercise guide and goal setting sheet (cancercare.on.ca/symptoms).

Take care of your mind and body

Your mind, body and feelings are very connected. Coping with pain can be upsetting and stressful and these feelings can make your pain feel worse.

It may be helpful for you to:

- Talk to someone you trust about how your pain makes you feel
- Talk to your health care team or a counsellor
- Talk to your spiritual or religious leader if this is something that gives you comfort
- Join a special self-help or pain self-management group to learn how to manage your pain. Ask your health care team about programs in your community

The activities below may help you relax or keep your mind off your pain:

- Deep breathing exercises or meditation
- Activities you enjoy such as puzzles, crafts, hobbies or watching TV
- Walking outside, gardening, enjoying nature, reading or listening to music

If your pain is making you sad, nervous or worried, speak to your health care team about these feelings.

Cancer treatments

Radiation therapy may help control pain, especially for people with cancer that has spread to their bones. Chemotherapy treatments can also help with pain for some people.

Using heat and/or ice

Applying heat and/or ice to the body may help for mild cancer pain. Heat can ease sore muscles and ice can help to numb an area.

Heat and ice may not be safe if you are getting radiation therapy, chemotherapy or if you have numbness from nerve damage.

Check with your health care team before you try these.

Complementary therapies

Complementary therapies are treatments you can try along with your regular cancer treatments to help you manage your pain. Talk to your health care team before trying any complementary therapies to make sure they are safe for you.

You may try:

- Massage therapy
- Aromatherapy
- Music therapy
- Reflexology
- Acupuncture
- Transcutaneous electrical nerve stimulation (TENS machine)
- Reiki
- Hypnotherapy

For more information about these therapies, go to the Canadian Cancer Society's website at cancer.ca

Talking to your health care team about pain.

Do not be afraid to tell your health care team that you are in pain.

Describe your pain to your health care team

Your health care team needs to know details about your pain so that they can help you feel better.

Think about your answers to the following questions to describe your pain to your health care team:

- What does your pain feel like? Is it burning, aching, stabbing, piercing or throbbing etc.?
- Would you describe your pain as mild, medium or severe?
- What makes your pain better? What makes it worse?
- Does your pain go away or get better when you take your medicine?
- Is your pain getting in the way of doing your daily activities and taking care of yourself?
- Is your pain causing you stress?

Use a pain diary to keep track of your pain

A pain diary is a place to record details about your pain. It can help you see how your pain changes over time and what makes it better or worse.

Here is a sample of a pain diary* you could use to write down information about your pain.

Patient Story:
"Keeping a pain diary is a great communication tool for me and my doctor. Together we can understand how to adjust my medicine to help me feel better."

Notes								
How long did the pain last?								
Non-medications techniques I tried (e.g., exercise, acupuncture)								
Name of medicine and amount taken								
What was I doing when I started to feel pain?								
What does the pain feel like (e.g. tingling feeling)								
Where do you feel pain?								
Rate your pain on a scale of 0 to 10 (0 is no pain and 10 is the worst possible pain)								
Time								
Date								

*Pain diary from the American Cancer Society

Key points:

- You do not need to live in pain. Cancer pain can be treated to help you live comfortably
- Taking pain medicine and doing other treatments together will likely work best to treat your pain
- Talk to your health care team about your pain often. Let them know about any changes you feel

Where to get more information about pain

Go to the websites below for more information and support services.
